Introduction

Raw data document:

This document lists the groups who have scores on the Personal Wellbeing Index (PWI) either <70 (no bold) or >**79 (bold)**. These values have been chosen to represent values beyond the normal range. To the extent of our current understanding, groups who score below 70 contain a higher than normal proportion of members who are in homeostatic failure, and therefore highly susceptible to depression. At the other end of the range, 79 is an usually high group score and very few groups have a reliable score (i.e. The number of members in large enough to be reliable) in excess of 81.

The document is organised hierarchically as follows:

- . Income
- . Gender
- . Age
- . Household Structure
- . Relationship Status

The code (e.g. 7:3.1 is Survey 7, Table 3.1).

Summary document:

When the Raw Data document indicates more than one data set for a category, we need a combined mean to be calculated as follows:

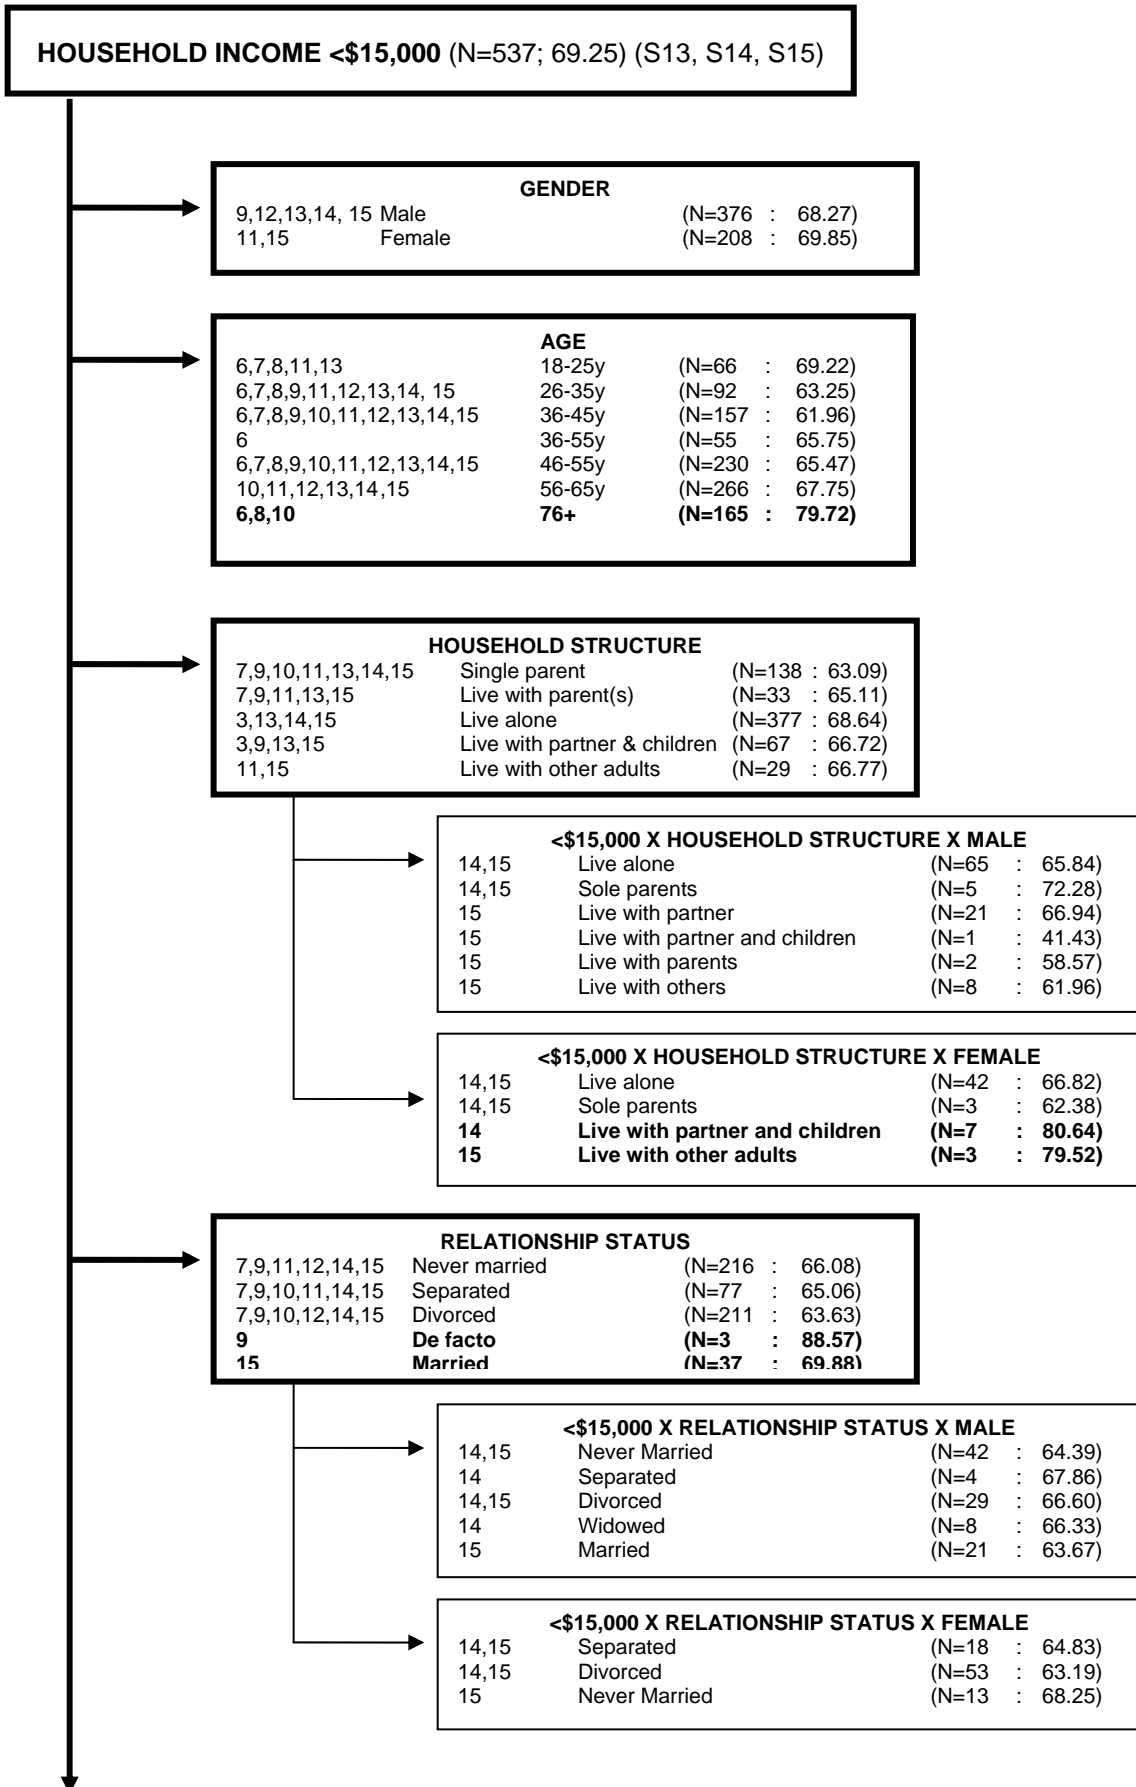

Survey 7 - N=10 : 65.00

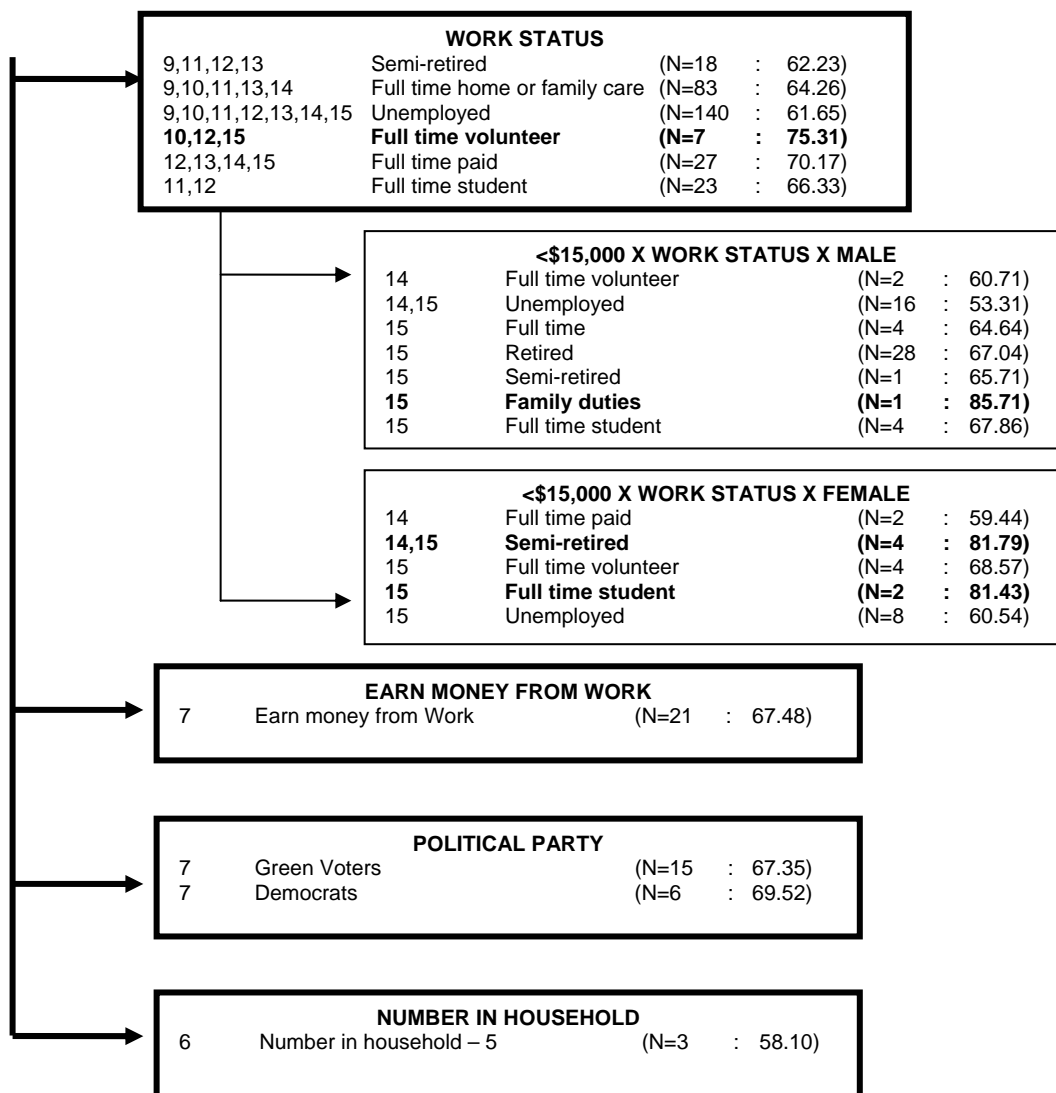

Survey 8 - N=20 : 67.00

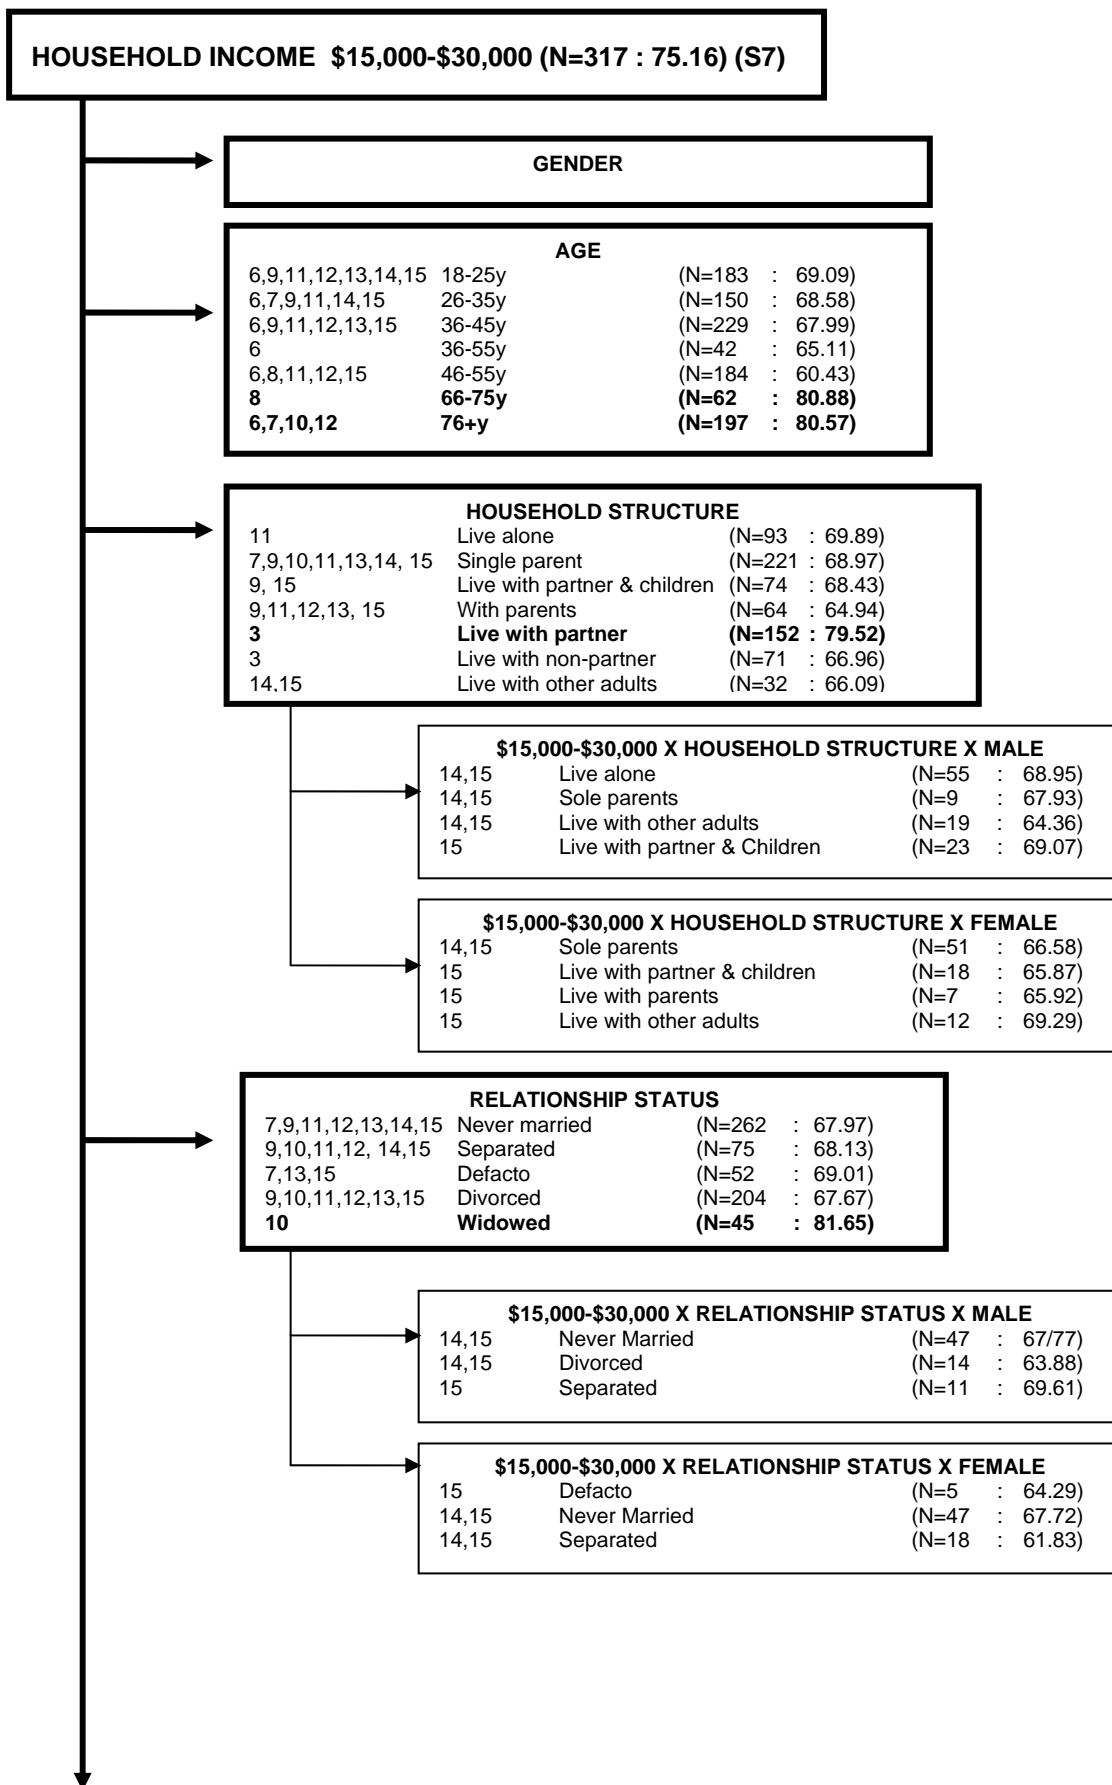

$$\text{Average} = \frac{(10 \times 65.00) + (20 \times 67.00)}{10 + 20} = 66.33$$

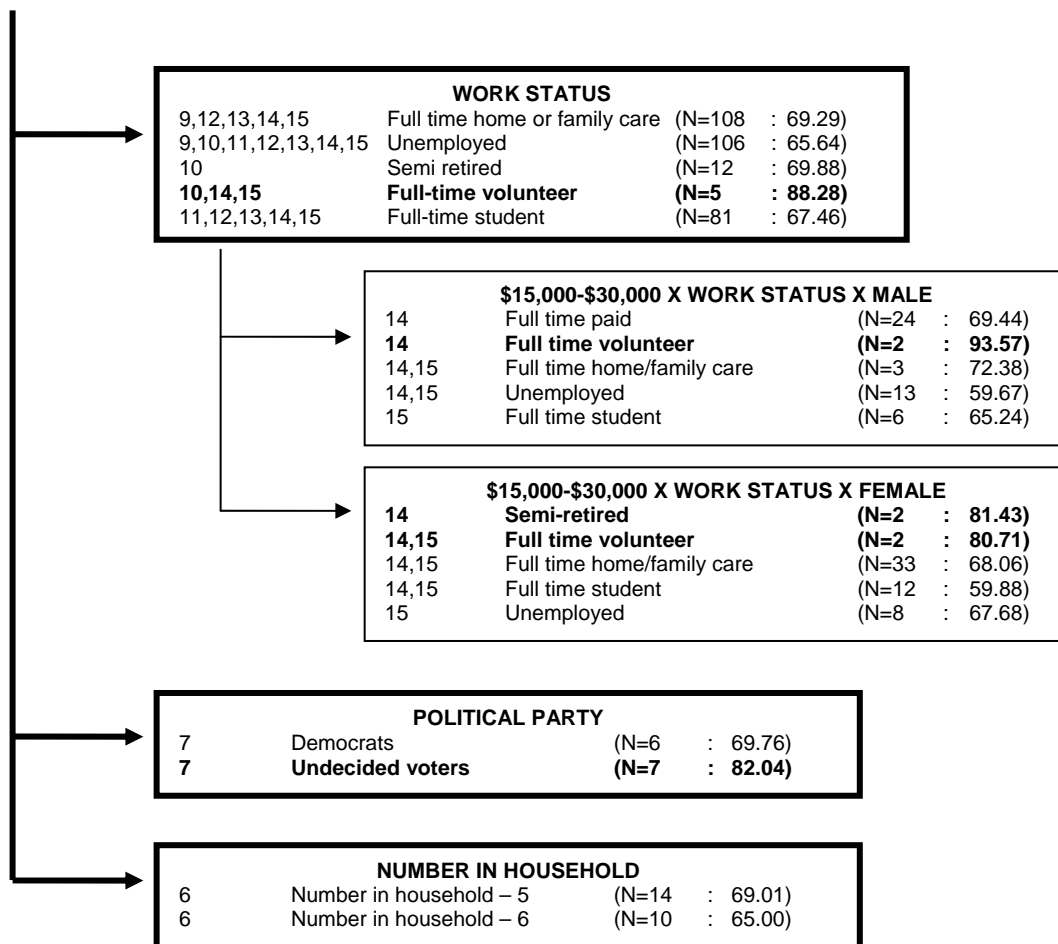

The combined mean is then entered into the Summary document.
